

Exception Flows

Process Milestone Payment & Release High-Res File (UC-04) Digital Art Commission & Watermarking Portal — Problem Statement #58

An exception flow describes a condition in which the expected path cannot complete normally. The supplied UC-04 specification explicitly documents payment failure and expired download-link handling; the flows below present those failure-oriented scenarios without adding unsupported system behavior.

EF-01 — Payment Failure After Retry Limit

A payment failure becomes a terminal failure after two consecutive unsuccessful attempts. The system temporarily locks further payment attempts instead of unlocking the asset.

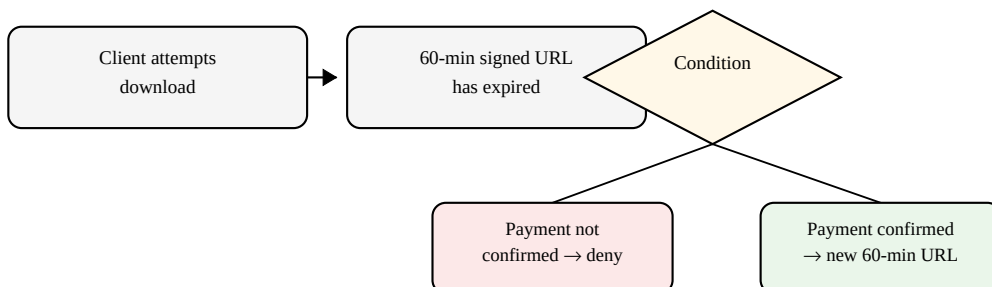

What happens, step by step:

- Payment Gateway returns a decline event.
- System displays a "Payment Failed" banner with the decline reason and offers a retry.
- The Client Buyer may retry using the same or a different payment method.
- If payment fails twice consecutively, the system locks the payment attempt for 15 minutes.
- A notification email is sent to the Client Buyer.
- The milestone remains "Pending Payment" and the use case ends in failure.

Who's involved: Client Buyer, Payment Gateway.

EF-02 — Signed URL Expired Before Download

If the Client Buyer tries to download the paid high-resolution asset after the signed S3 URL has expired, access is denied. The system validates payment before generating a new link.

What happens, step by step:

- Client Buyer attempts to download after the 60-minute TTL has elapsed.
- System returns an "Access Denied - Link Expired" message.
- Client Buyer clicks [Generate New Link].

— System validates that payment is confirmed.

— If payment is confirmed, the system generates a new 60-minute signed S3 URL and the Client Buyer downloads the file.

Who's involved: Client Buyer, Object Storage (S3) as the asset-storage service.

Source note: The supplied UC-04 specification labels these scenarios as Alternate Flows (AF-1, AF-2, AF-3), rather than defining a separate Exception Flow section. This exception document therefore organizes the failure-oriented cases in the same presentation style as the reference PDF while preserving the specified behavior.
